

Miata Rain Rail Instructions for Part No. C-700R

Before removing rain rail from the old top please take note of the position of the existing rain rail for reference during installation of the new rain rail.

Remove old rain rail from top by using a pair of side cutters to cut the 15 rivets holding the rain rail to the top.

Install the new rain rail with the pop rivets and washers through the corresponding holes of the rain rail and the top.

Set the rain rail into position and place the holes in the rain rail over the threaded retainer studs.

Before tightening down the rain rail make sure the lip is turned upward and laying against the top.

When tightening down the rain rail it is important to alternate the tightening of the bolts by starting at the first stud on the driver side then going to the passenger side working back and forth until all 13 studs are tightened.
